pp4fpga Sparse Matrix Vector Multiplication report

System introduction

Sparse matrix vector (SpMV) multiplication performs the operation

$$y = M * x$$

where x and y are vectors, and M is a sparse matrix stored in the compressed row storage (CRS) form.

CRS form is commonly used when the matrix contains only a small number of nonzero elements (typically 10 percent or less), enabling a matrix to be stored +++with less memory and manipulated with fewer operations.

$$\begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{bmatrix} = \begin{bmatrix} m_{11} & m_{12} & 0 & 0 \\ 0 & m_{22} & m_{23} & 0 \\ m_{31} & 0 & m_{33} & m_{34} \\ 0 & m_{42} & 0 & m_{44} \end{bmatrix} * \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix}$$

Given a sparse matrix M in 2-dim representation as shown above, the corresponding CRS representation consists of three arrays:

♦ values

The values array holds the value of each nonzero element in the matrix.

$$[m_{11} \quad m_{12} \quad m_{22} \quad m_{23} \quad m_{31} \quad m_{33} \quad m_{34} \quad m_{42} \quad m_{44}]$$

The columnindex array stores the column index of each nonzero element.

$$[0 \ 1 \ 1 \ 2 \ 0 \ 2 \ 3 \ 1 \ 3]$$

♦ rowPtr

The rowPtr array contains the index in values array of the first element in each row. In this example, the index of m_{11} , m_{22} , m_{31} , m_{42} , and the total number of nonzero elements in values array are stored in rowPtr.

$$[0 \ 2 \ 4 \ 7 \ 9]$$

If there are rows in the matrix without a nonzero element, then values in the rowPtr array will repeat.

Given the CRS form representation, we can conclude that

- if values[k] = m_{ij} , then colIndex[k] = j
- if values[k] = m_{ij} , then rowPtr[i] \leq k < rowPtr[i + 1]
- the number of nonzero elements in row i is rowPtr[i + 1] − rowPtr[i]

Sparse matrix vector multiplication can be more efficiently computed by representing the matrix in CRS form, which can significantly reduce the operations required especially when the matrix is highly sparse.

Screen dump and Observations

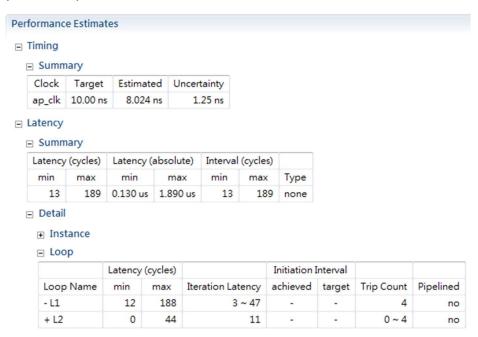

♦ Solution 1: Baseline implementation

```
L1: for (int i = 0; i < NUM_ROWS; i++) {
    y0 = 0;
    L2: for (int k = rowPtr[i]; k < rowPtr[i+1]; k++) {
        y0 += values[k] * x[columnIndex[k]];
    }
    y[i] = y0;
}
```

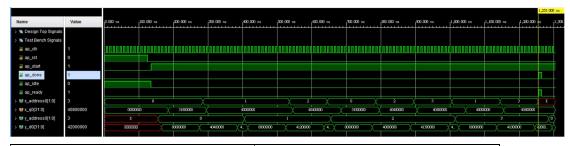

L1 iterates through each row of the matrix, and L2 iterates across the column of the matrix to accumulate the partial sum.

Utilization Estimates

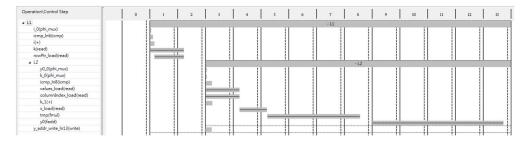

Summary DSP48E BRAM_18K LUT **URAM** Name FF DSP 78 Expression 0 **FIFO** Instance 5 348 711 Memory Multiplexer 89 Register 215 Total 0 563 878 0 Available 280 220 106400 53200 0 Utilization (%) 0 ~0

Total latency (cycles)	L2 max iteration latency (cycles)
112	36

The sparse matrix-vector multiplication requires variable operations in each iteration. Thus, the latency estimated in synthesis report is not accurate. Instead, we measure the latency from the cosim waveform.

♦ Analysis perspective

		Pipelined	Latency	Iteration Latency	Initiation Interval	Trip count
⊿ 0 spi	mv	-	13~189	-	14 ~ 190	-
4 0	L1	no	12 ~ 188	3 ~ 47	-	4
	0	no	0 ~ 44	11	-	0~4

♦ Solution 2: Pipeline L1

```
L1: for (int i = 0; i < NUM_ROWS; i++) {

# pragma HLS PIPELINE

y0 = 0;

L2: for (int k = rowPtr[i]; k < rowPtr[i+1]; k++) {

y0 += values[k] * x[columnIndex[k]];

}

y[i] = y0;
}
```

♦ Synthesis report/RTL Co-simulation

Total latency (cycles)

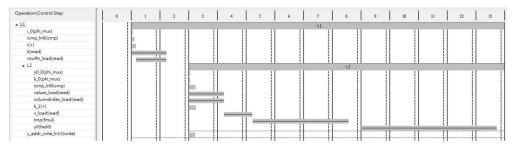

L2 max iteration latency (cycles)

112

36

There is no change to the overall performance since the L2 loop iteration is variable bounded. Thus, the L2 loop cannot be flatten.

♦ Analysis perspective

				Pipelined	Latency	Iteration Latency	Initiation Interval	Trip count
Δ	0	spr	nv	-	13~189	-	14 ~ 190	-
	Δ	0	L1	no	12 ~ 188	3 ~ 47	-	4
			0	no	0 ~ 44	11	-	0~4

♦ Solution 3: Pipeline L2

```
L1: for (int i = 0; i < NUM_ROWS; i++) {
    y0 = 0;
    L2: for (int k = rowPtr[i]; k < rowPtr[i+1]; k++) {
# pragma HLS PIPELINE
    y0 += values[k] * x[columnIndex[k]];
    }
    y[i] = y0;
}
```

Total latency (cycles)	L2 max iteration latency (cycles)
82	24

Pipelining to the inner L2 loop can reduce the latency required. However, the II is limited by the floating-point addition in each iteration.

♦ Analysis perspective

			Pipelined	Latency	Iteration Latency	Initiation Interval	Trip count
4 0	spi	mv	-	17~117	-	18 ~ 118	-
4	0	L1	no	16 ~ 116	4 ~ 29	-	4
		0	yes	0 ~ 25	11	5	0~4

The blue mark shows the limiting operation.

Solution 4: Pipeline L2 + Unroll L2 with factor 4

```
L1: for (int i = 0; i < NUM_ROWS; i++) {
    y0 = 0;
    L2: for (int k = rowPtr[i]; k < rowPtr[i+1]; k++) {
# pragma HLS PIPELINE
# pragma HLS UNROLL factor=4
    y0 += values[k] * x[columnIndex[k]];
    }
    y[i] = y0;
}
```

Total latency (cycles)	L2 max iteration latency (cycles)
101	37

Unrolling the L2 loop does no help in latency since the floating point addition is performed successively.
